### **Supporting California Standards**

**Mathematics Continuum: Grades 4-6** 

N/A		Ratios and Proportional Relationships
Grade 4	Grade 5	Grade 6
None	None	Understand ratio concepts and use ratio reasoning to solve problems.
		6.RP.1. Understand the concept of a ratio and use ratio language to describe a ratio relationship between two quantities. For example, "The ratio of wings to beaks in the bird house at the zoo was 2:1, because for every
		2 wings there was 1 beak." "For every vote candidate A received, candidate C received nearly three votes."
		6.RP.2. Understand the concept of a unit rate a/b associated with a ratio a:b with b≠0, and use rate language in the context of a ratio relationship. For example, "This recipe has a ratio of 3 cups of flour to 4 cups of
		sugar, so there is 3/4 cup of flour for each cup of sugar." "We paid \$75 for 15 hamburgers, which is a rate of \$5 per hamburger." [1 Expectations for unit rates in this grade are limited to non-complex
		fractions.]
		6.RP.3. Use ratio and rate reasoning to solve real-world and mathematical problems, e.g., by reasoning about tables of equivalent ratios, tape diagrams, double number line diagrams, or equations.
		a. Make tables of equivalent ratios relating quantities with whole number measurements, find missing values in the tables, and plot the pairs of values on the coordinate plane. Use tables to compare ratios.
		b. Solve unit rate problems including those involving unit pricing and constant speed. For example, if it took 7 hours to mow 4 lawns, then at that rate, how many lawns could be mowed in 35 hours? At what rate
		were lawns being mowed?
		c. Find a percent of a quantity as a rate per 100 (e.g., 30% of a quantity means 30/100 times the quantity); solve problems involving finding the whole, given a part and the percent.
		d. Use ratio reasoning to convert measurement units; manipulate and transform units appropriately when multiplying or dividing quantities.

### **Supporting California Standards**

Operations and	Algebraic Thinking	Expressions and Equations		
Grade 4	Grade 5	Grade 6		
Use the four operations with whole numbers to solve problems.  4.OA.1. Interpret a multiplication equation as a comparison, e.g., interpret 35 = 5 × 7 as a statement that 35 is 5 times as many as 7 and 7 times as many as 5. Represent verbal statements of multiplicative comparisons as multiplication equations.  4.OA.2. Multiply or divide to solve word problems involving multiplicative comparison, e.g., by using drawings and equations with a symbol for the unknown number to represent the problem, distinguishing multiplicative comparison from additive comparison.¹ [¹See Glossary, Table 2]  4.OA.3. Solve multistep word problems posed with whole numbers and having whole-number answers using the four operations, including problems in which remainders must be interpreted. Represent these problems using equations with a letter standing for the unknown quantity. Assess the reasonableness of answers using mental computation and estimation strategies including rounding.  Gain familiarity with factors and multiples.  4.OA.4. Find all factor pairs for a whole number in the range 1–100. Recognize that a whole number is a multiple of each of its factors. Determine whether a given whole number in the range 1–100 is a multiple of a given one-digit number. Determine whether a given whole number in the range 1–100 is prime or composite.  Generate and analyze patterns.  4.OA.5. Generate a number or shape pattern that follows a given rule. Identify apparent features of the pattern that were not explicit in the rule itself. For example, given the rule "Add 3" and the starting number 1, generate terms in the resulting sequence and observe that the terms appear to alternate between odd and even numbers. Explain informally why the numbers will continue to alternate in this way.	<ul> <li>Write and interpret numerical expressions.</li> <li>5.OA.1. Use parentheses, brackets, or braces in numerical expressions, and evaluate expressions with these symbols.</li> <li>5.OA.2. Write simple expressions that record calculations with numbers, and interpret numerical expressions without evaluating them. For example, express the calculation "add 8 and 7, then multiply by 2" as 2 × (8 + 7). Recognize that 3 × (18932 + 921) is three times as large as 18932 + 921, without having to calculate the indicated sum or product.</li> <li>5.OA.2.1 Express a whole number in the range 2–50 as a product of its prime factors. For example, find the prime factors of 24 and express 24 as 2x2x2x3. CA Analyze patterns and relationships.</li> <li>5.OA.3. Generate two numerical patterns using two given rules. Identify apparent relationships between corresponding terms. Form ordered pairs consisting of corresponding</li> </ul>	<ul> <li>Apply and extend previous understandings of arithmetic to algebraic expressions.</li> <li>6.EE.1. Write and evaluate numerical expressions involving whole-number exponents.</li> <li>6.EE.2. Write, read, and evaluate expressions in which letters stand for numbers.</li> <li>a. Write expressions that record operations with numbers and with letters standing for numbers. For example, express the calculation "Subtract y from 5" as 5 − y.</li> <li>b. Identify parts of an expression using mathematical terms (sum, term, product, factor, quotient, coefficient): view one or more parts of an expression as a single entity. For example, describe the expression 2 (8 + 7) as a product of two factors; view (8 + 7) as both a single entity and a sum of two terms.</li> <li>c. Evaluate expressions at specific values of their variables. Include expressions that arise from formulas used in real-world problems. Perform arithmetic operations, including those involving whole-number exponents, in the conventional order when there are no parentheses to specify a particular order (Order of Operations). For example, use the formulas V = s² and A = 6 s² to find the volume and surface area of a cube with sides of length s = 1/2.</li> <li>6.EE.3. Apply the properties of operations to generate equivalent expressions. For example, apply the distributive property to the expression 3 (2 + x) to produce the equivalent expression 6 + 3x; apply the distributive property to the expressions are equivalent expression 3y.</li> <li>6.EE.4. Identify when two expressions are equivalent expression 3y.</li> <li>6.EE.5. Understand solving an equation or inequality the expressions and the same number regardless of which number y stands for.</li> <li>6.EE.6. Use variables to represent numbers and write expressions when solving a question: which values from a specified set, fi any, make the equation or inequality true.</li> <li>6.EE.6. Use variables to represent numbers and write expressions when solving a real-world or mathematical problem; understand</li></ul>

#### Cont

- 4.NF.6. Use decimal notation for fractions with denominators 10 or 100. For example, rewrite 0.62 as 62/100; describe a length as 0.62 meters; locate 0.62 on a number line diagram.
- 4.NF.7. Compare two decimals to hundredths by reasoning about their size. Recognize that comparisons are valid only when the two decimals refer to the same whole. Record the results of comparisons with the symbols >, =, or <, and justify the conclusions, e.g., by using **the number line or another** visual model. **CA**

#### Cont.

- 5.NF.6. Solve real world problems involving multiplication of fractions and mixed numbers, e.g., by using visual fraction models or equations to represent the problem.
- 5.NF.7. Apply and extend previous understandings of division to divide unit fractions by whole numbers and whole numbers by unit fractions.<sup>1</sup> [¹Students able to multiply fractions in general can develop strategies to divide fractions in general, by reasoning about the relationship between multiplication and division. But division of a fraction by a fraction is not a requirement at this grade.]
  - a. Interpret division of a unit fraction by a non-zero whole number, and compute such quotients. For example, create a story context for  $(1/3) \div 4$ , and use a visual fraction model to show the quotient. Use the relationship between multiplication and division to explain that  $(1/3) \div 4 = 1/12$  because  $(1/12) \times 4 = 1/3$ .
  - b. Interpret division of a whole number by a unit fraction, and compute such quotients. For example, create a story context for  $4 \div (1/5)$ , and use a visual fraction model to show the quotient. Use the relationship between multiplication and division to explain that  $4 \div (1/5) = 20$  because  $20 \times (1/5) = 4$ .
  - c. Solve real world problems involving division of unit fractions by non-zero whole numbers and division of whole numbers by unit fractions, e.g., by using visual fraction models and equations to represent the problem. For example, how much chocolate will each person get if 3 people share 1/2 lb of chocolate equally? How many 1/3-cup servings are in 2 cups of raisins?

Solve problems involving measurement and conversion of measurements from a larger unit to a smaller unit.  4.MD.1. Represent measurement quantities using diagrams such as number lime diagrams that feature a measurement quantities using diagrams such as number lime diagrams that feature a measurement promoter formulas for rectangles in real world and mathematical problems. For example, find the width of a rectangular room given the area of the flooring and the length, by viewing the area formulas as multiplication equation with an unknown factor.  Represent and interpret data.  A MID 4. Make a line plot to display a data set of measurements in fractions of a unit (12, 1/4, 1/8). Solve problems involving addition and subtraction of fractions by using information presented in line plots. For example, limit the width of a rectangular room given the area of the flooring and the length between the longest and shortest specimens in various in an insect of collection.  Represent and interpret data.  Represent as a multiplication and subtraction of fractions by using information presented in line plots. For example, limit to display as an attribute of solid figures and understand concepts of solid givers and understand concepts of angle and measure angles.  AMD 5. Recognize angles as generated value and the present in the lotal amount in all the beakers would contain if the total amount in all the beakers, find the amount of liquid each beaker would contain if the total amount in all the beakers would contain if the total amount in all the beakers were edistributed equally.  Recometric measurement can desire the all the present of the seal of the base as an attribute of solid figures an	a larger unit in terms of a smaller unit. Record measurement equivalents in a two-column table.	Represent and interpret data.	
4.MD.2. Use the four operations to solve word problems involving distances, intervals of time, liquid volumes, masses of objects, and money, including problems involving simple factions or decimals, and problems that require expressing measurements given in a larger unit in terms of a smaller unit. Represent measurement quantities using diagrams such as number line diagrams that feature a measurement scale.  4.MD.3. Apply the area and perimeter formulas for rectangles in real world and mathematical problems. For example, find the width of a rectangular room given the area of the flooring and the length, by viewing the area formula as a multiplication equation with an unknown factor.  Represent and interpret data.  4.MD.4. Make a line plot to display a data set of measurements in fractions of a unit (1/2, 1/4, 1/8). Solve problems involving addition and subtraction of fractions by using information presented in line plots. For example, find the width of a rectangular room given the area of the flooring and the legal with side length 1 unit, called a "unit cube," is said to have "one cubic unit." Government understand concepts of any the measurements of including the packed without gaps or overlaps using n unit cubes is said to have a volume of n cubic units.  5.MD.4. Measure volumes by counting unit cubes, using cubic cm, cubic in, cubic it, and improvised units.  5.MD.4. Measure volumes by counting unit cubes, using cubic cm, cubic in, cubic it, and improvised units.  5.MD.5. Recognize angle measure angles in whole-number degrees using a protractor. Sketch angles of specified measure angles.  4.MD.6. Measure volume as an additive. When an angle is decomposed into non-overlapping parts, the angle measure a additive. When an angle is decomposed into non-overlapping parts, the angle measures additive. When an angle is decomposed of the post of the parts. Solve addition and subtraction problems to find unknown angles on a diagram in real world and mathematical problems.  5.MD.5. Measure volumes of a great world and			
volumes, masses of objects, and money, including problems involving simple fractions or decimals, and problems that require expressing measurements given in a larger unit in terms of a smaller unit. Represent measurement quantities using diagrams such as number line diagrams that feature a measurement scale.  4.MD.3. Apply the area and perimeter formulas for rectangles in real world and mathematical problems. For example, find the width of a rectangular room given the area of the flooring and the length, by viewing the area formula as a multiplication equation with an unknown factor.  Represent and interpret data.  4.MD.4. Mexe all ne plot to display a data set of measurements in fractions of a unit (1/2, 1/4, 1/8). Solve problems involving addition and subtraction of fractions by using information presented in line plots. For example, from a line plot to display a data set of measurement:  4.MD.5. Recognize angles as geometric shapes that are formed wherever two rays share a common endpoint, and understand concepts of angle measurement:  a. A nangle is measured with reference to a circle with its center at the common endpoint of the rays, by considering the fraction of the circular arc between the points where the two rays intersect the circle. An angle that turns through 1/360 of a circle is called a "one-degree angle," and can be used to measure angles.  4.MD.6. Reasoure angles in whole-number degrees using a protractor. Sketch angles of specified measure.  4.MD.7. Recognize angle as geometric shapes that are formed wherever two rays share a common endpoint, and understand concepts of angle measurement.  a. A nangle that turns through 1/360 of a circle is called a "one-degree angle," and can be used to measure angles.  4.MD.6. Measure angles in whole-number degrees using a protractor. Sketch angles of specified measure.  4.MD.7. Recognize angle as geometric shapes that are formed wherever two rays interested the circle. An angle that turns through 1/360 of a circle is called a "one-degree angle," and can be			
beaker would contain if the total amount in all the beakers were redistributed smaller unit. Represent measurement quantities using diagrams such as number line diagrams that feature a measurement scale.  4.MD.3. Apply the area and perimeter formulas for rectangles in eal world and mathematical problems. For example, find the width of a rectangular room given the area of the flooring and the length, by viewing the area formula as a multiplication equation with an unknown factor.  4.MD.4. Make a line plot to display a data set of measurements in fractions of a unit (1/2, 1/4, 1/8). Solve problems involving addition and subtraction of fractions by using information presented in line plots. For example, from a line plot find and interpret the difference in length between the longest and shorfest specimens in an insect collection.  4.MD.5. Recognize angles as geometric shapes that are formed wherever two rays share a common endpoint, and understand concepts of angle measurement:  4.MD.6. Recognize angles as geometric shapes that are formed wherever two rays share a common endpoint, and understand concepts of angle and measure angles.  4.MD.6. Recognize angles as geometric shapes that are formed wherever two rays share a common endpoint, and understand concepts of angle measurement:  5.MD.6. Measure volume of n circle with its center at the common endpoint of the rays, by considering the fraction of the circular arc between the points where the two rays intersect the circle. An angle that turns through 1/360 of a circle is called a "one-degree angle," and can be used to measure angles.  4.MD.6. Measure angles in whole-number degrees using a protractor. Sketch angles of specified measure.  5.MD.6. Measure angles in whole-number degrees using a protractor. Sketch angles of specified measure.  6.MD.7. Recognize angle measure and the product as a diditive. When an angle is decomposed into non-overlapping parts, the angle measure of the whole word and mathematical problems.  7. Recognize volume as a additive. Find volume			
smaller unit. Represent measurement quantities using diagrams such as number line diagrams that feature a measurement scale problems. For example, find the width of a rectangles in real world and mathematical problems. For example, find the width of a rectanglar room given the area of the flooring and the length, by viewing the area formula as a multiplication equation with an unknown factor.  Represent and interpret data.  4.MD.4. Make a line plot to display a data set of measurements in fractions of a unit (1/2, 1/4, 1/8). Solve problems involving addition and subtraction of fractions by using information presented in line plots. For example, from a line plot find and interpret the difference in length between the longest and shortest specimens in an insect collection.  Geometric measurement: understand concepts of single and measure angles.  4.MD.5. Recognize angles as geometric shapes that are formed wherever two rays share a common endpoint, and understand concepts of angle and measure angles.  4.MD.6. Recognize angles as geometric shapes that are formed wherever two rays share a common endpoint, and understand concepts of angle measurement: understand concepts of single and measure angles.  5.MD.4. Makes a line plot to display a data set of measurements in fractions of which is provided in the work of the circle an analyse of the difference in length between the longest and shortest specimens in an insect collection.  6.Measure volume as an attribute of solid figures and understand concepts of solid figures of volume.  5.MD.6. Recognize volume as an attribute of			
that feature a measurement scale.  4.MD.3. Apply the area and perimeter formulas for rectangles in real world and mathematical problems. For example, find the width of a rectangular room given the area of the flooring and the length, by viewing the area formula as a multiplication equation with an unknown factor.  Represent and interpret data.  4.MD.4. Make a line plot to display a data set of measurements in fractions of a unit (1/2, 1/4, 1/8). Solve problems involving addition and subtraction of fractions by using information presented in line plots. For example, from a line plot find and interpret the difference in length between the longest and shortest specimens in an insect collection.  6cometric measurement: understand concepts of solid figures and understand concepts of anyle measurement and interpret data.  4.MD.5. Recognize angles as geometric shapes that are formed wherever two rays share a common endpoint, and understand concepts of angle measurement:  a. An angle is measured with reference to a circle with its center at the common endpoint of the rays, by considering the fraction of the circular are between the points where the two rays intersect the circle. An angle that turns through 1/360 of a circle is called a "one-degree angle," and can be used to measure angles in whole-number degrees using a protractor. Sketch angles of specified measure.  4.MD.6. Measure angle measure angles in whole-number degrees using a protractor. Sketch angles of specified measure.  4.MD.7. Recognize angle measure as additive. When an angle is decomposed into non-overlapping parts, the angle measure as additive. The relation and addition and subtraction problems to find and distinct and to addition.  5.MD.5. Recognize volume as an attribute of solid figures and understand concepts of solid figures and understand concepts of solid figures completed.  4.MD.6. Weasure volumes of solid figures converlaps unit turns through reference to a circle with its center at the common endpoint of the rays, by considering the fractio

magnomagous problems, e.g., by deing an equation with a symbol for the different angle medeute.   Here eventuping parte, applying this technique to solve real world			
problems.	mathematical problems, e.g., by using an equation with a symbol for the driknown drigle measure.		

N/A	<u> </u>	Statistics and Probability
Grade 4	Grade 5	Grade 6
None	None	Develop understanding of statistical variability.  6.SP.1. Recognize a statistical question as one that anticipates variability in the data related to the question and accounts for it in the answers. For example, "How old am 1?" is not a statistical question, but "How old are the students in my school?" is a statistical question because one anticipates variability in students' ages.  6.SP.2. Understand that a set of data collected to answer a statistical question has a distribution which can be described by its center, spread, and overall shape.  6.SP.3. Recognize that a measure of center for a numerical data set summarizes all of its values with a single number, while a measure of variation describes how its values vary with a single number.  Summarize and describe distributions.  6.SP.4. Display numerical data in plots on a number line, including dot plots, histograms, and box plots.  6.SP.5. Summarize numerical data sets in relation to their context, such as by:  a. Reporting the number of observations.  b. Describing the nature of the attribute under investigation, including how it was measured and its units of measurement.  c. Giving quantitative measures of center (median and/or mean) and variability (interquartile range and/or mean absolute deviation), as well as describing any overall pattern and any striking deviations from the overall pattern with reference to the context in which the data were gathered.  d. Relating the choice of measures of center and variability to the shape of the data distribution and the context in which the data were gathered.

### **Standards for Mathematical Practice (K-12)**

- 1. Make sense of problems and persevere in solving them.
- 2. Reason abstractly and quantitatively.
- 3. Construct viable arguments and critique the reasoning of others
- 4. Model with mathematics

- 5. Use appropriate tools strategically
- 6. Attend to precision.
- 7. Look for and make use of structure.
- 8. Look for and express regularity in repeated reasoning.
